

Robust Notions of Contextual Fibrancy

Andreas Nuyts

KU Leuven, Belgium

Workshop on HoTT/UF '18

Oxford, UK

July 8, 2018

Problem statement

Cat. of contexts	Cubical sets	Simplicial sets	Cubical sets
Notion of fibrancy	Kan	Segal	Discreteness
Gen. left maps	$\sqcup \subseteq \square$	spine \subseteq simplex ($\exists!$)	$\Phi \times \mathbb{I} \rightarrow \Phi$
Closed fibrant types?	∞ -Groupoids	Categories	Sets
Π_A preserves fibrancy?	if A fibrant	if A Conduché "composite \subseteq simplex"	YES
Fib. repl. commutes with substitution?	NO	NO	YES

How to get YESses everywhere?

Problem statement

Fibrancy of Π in general

Let $\eta : \Lambda \rightarrow \Delta$ be a **generating left map**.

$$\begin{array}{ccc} \Lambda & \xrightarrow{(\gamma\eta, \lambda b)} & \Gamma.\Pi AB \\ \eta \downarrow & \nearrow (\gamma, \lambda b') & \downarrow \pi \\ \Delta & \xrightarrow{\gamma} & \Gamma \end{array} \quad \Leftrightarrow \quad \begin{array}{ccc} \Lambda.A[\gamma\eta] & \xrightarrow{(\gamma\eta.\text{id}_A, b)} & \Gamma.A.B \\ \eta.\text{id}_A \downarrow & \nearrow (\gamma.\text{id}_A, b') & \downarrow \pi \\ \Delta.A[\gamma] & \xrightarrow{\gamma.\text{id}_A} & \Gamma.A \end{array}$$

So if the **pullback** $\eta.\text{id}_A$ of η is a **left map**, we're **good!**

Definition

Class of right maps is **robust** if generated by some left maps whose pullbacks are also left maps.

Fibrancy of Π in general

Let $\eta : \Lambda \rightarrow \Delta$ be a **generating left map**.

$$\begin{array}{ccc} \Lambda & \xrightarrow{(\gamma\eta, \lambda b)} & \Gamma.\Pi AB \\ \eta \downarrow & \nearrow (\gamma, \lambda b') & \downarrow \pi \\ \Delta & \xrightarrow{\gamma} & \Gamma \end{array} \quad \Leftrightarrow \quad \begin{array}{ccc} \Lambda.A[\gamma\eta] & \xrightarrow{(\gamma\eta.\text{id}_A, b)} & \Gamma.A.B \\ \eta.\text{id}_A \downarrow & \nearrow (\gamma.\text{id}_A, b') & \downarrow \pi \\ \Delta.A[\gamma] & \xrightarrow{\gamma.\text{id}_A} & \Gamma.A \end{array}$$

So if the **pullback** $\eta.\text{id}_A$ of η is a **left map**, we're **good!**

Definition

Class of right maps is **robust** if generated by some left maps whose pullbacks are also left maps.

Theorem

Discreteness is robust.

Proof:

$$\begin{array}{ccc} \Xi \times \mathbb{I} & \longrightarrow & \Phi \times \mathbb{I} \\ \downarrow \lrcorner & & \downarrow \\ \Xi & \longrightarrow & \Phi \end{array}$$

Force Kan fibrancy to be robust?

Then everything is equal!
(That's bad.)

Contextual fibrancy

Definition

$\Gamma|\Theta \vdash A \mathbf{fib}$ if:

$$\begin{array}{ccc} \Lambda & \longrightarrow & \Gamma.\Theta.A \\ \downarrow & \nearrow \text{dotted} & \downarrow \\ \Delta & \longrightarrow & \Gamma.\Theta \\ \downarrow & & \downarrow \\ \Psi & \longrightarrow & \Gamma \end{array}$$

for all gen. “**damped**” left maps.

Theorem

$$\frac{\Gamma \vdash A \mathbf{type} \quad \Gamma.A|\Theta \vdash B \mathbf{fib}}{\Gamma|\Theta \vdash \Pi A B \mathbf{fib}} \textit{robust}$$

Definition

Contextual fibrancy is **robust** if generated by some ‘damped left maps’ whose pullbacks

$$\begin{array}{ccc} \Psi' \times_{\Psi} \Lambda & \longrightarrow & \Lambda \\ \downarrow \lrcorner & & \downarrow \\ \Psi' \times_{\Psi} \Delta & \longrightarrow & \Delta \\ \downarrow \lrcorner & & \downarrow \\ \Psi' & \longrightarrow & \Psi \end{array}$$

are also damped left maps.

Definition

Definition (Contextual fibrant replacement)

(Defined up to isomorphism.)

Definition (Contextual fibrant replacement)

(Defined up to isomorphism.)

Theorem

Natural in Γ : $(\mathcal{R}_\Theta T)[\sigma] \cong \mathcal{R}_\Theta(T[\sigma])$.

Proof ($\sigma = \pi : \Gamma.A \rightarrow \Gamma$).

Take home message

Robustness:

- Makes $\Pi AB\mathbf{fib}$ if $B\mathbf{fib}$,
- Makes \mathcal{R} natural,
- Is more achievable with contextual fibrancy.

Question

Is robustness “exactly” what can be internalized?

Thanks!
